

Supplementary Figure S3. Comparative signal distributions across curated Gli3 limb enhancers and validated non-limb Gli3-region enhancers.

Boxplots with overlaid individual enhancer values compare 13 curated Gli3 limb enhancers and 41 validated non-limb VISTA enhancers from the Gli3 region for (A) combined HOX13 signal, calculated as HOXA13 mean plus HOXD13 mean, (B) active enhancer score, calculated as H3K4me1 mean plus H3K27ac mean, (C) GLI3 mean signal, and (D) PITX1 mean signal averaged across two hindlimb tracks. The substantial overlap between limb and non-limb enhancer classes supports the interpretation that individual bulk transcription-factor occupancy or chromatin-mark layers are not sufficient to classify Gli3 limb enhancer identity. Data are provided in Supplementary Table S6a.
